

This is my erd. I have one customer, who can make a purchase of either tickets or something from the concessions.

Each customer can have a purchase, and does not have to purchase a concession. Every ticket is only good for one movie, however there are different movies for the customer to choose from. Making this table is a lot easier than entering all the data in.

Customer		
 customer_id	serial	
first_name	varchar(30)	
last_name	varchar(30)	
payment_info	varchar(50)	
phone	int(10)	

Purchase		
 purchase_id	serial	
total	float4	
when_bought	timestamp	
customer_id	int	

Concession		
 concession_id	serial	
concession_name	int	
price	float4	
purchase_id	serial	

Tickets		
 ticket_id	serial	
price	float4(20)	
purchase_id	serial	
movie_id	serial	

Movies		
 movie_id	serial	
title	varchar(50)	
rating	varchar(10)
